How I got introduced to Coding

Before I picked up coding,I watched a regular show episode where they made his own video game.That gave me a touch of inspiration to learn coding but I hardly knew what that was and that passion died fast.It was like it was only there because I watched a cartoon episode about it I was more into drawing and origami as a kid.Until much much much and I mean years later like two to three years later when I was in primary four and I was playing a squirt gun fight with my brothers in the evening Dad called us to talk to something special and for the first time in a long time(since I didn't have the lego I wanted),my imagination blew above ceilings.Like...I know scratch is a baby's tool but when I gazed on it,I saw game development possible and very fun.Not to mention that at the time,I watched a lot of game shakers episodes and played a few of their games and was fascinated by how these games were made.So in primary four,I learnt scratch.My scratch learning path is pretty rememorable so I don't have to type this down.Later,I wanted an advancement from scratch and after doing my first research in programming languages,I saw options like lua,python,Java,C++.I saw a roblox picture under the lua heading which I didn't know what it was until later in Jss2.I wrongly assumed that lua was python with a lot of syntax sensitive rules and as such,hardest didn't really know the world of coding and I assumed there were only like four or five coding languages.I taught Java was the next step,so I decided to take it which I didn't until two years later after dad introduced us to codakid

I also enjoyed robotics since I watched a video from dad about it but never learnt it since I didn't have the required hardware.

Later,I felt that learning java wasn't feasible for me at the time so I saw python,did some small research on it and heard that even 8 years old could do it so why couldn't I.I learnt python through a lot of copy and paste since it was my first text types language and essentially,I didn't truly learn anything about it except for how to print hello world.I didn't pick up python again till SS3.Thats over six years later

Back in jss 3 or 2,I think I was into cyber security and ethical hacking because I taught that it would be cool like every other kid.I was planning to learn coding no longer for games but for white hacking.I just felt that learning to code for games was the adrenaline I needed to learn coding for much more and greater purposes like cyber security and white hacking which I still found as fun.I learnt a lot about hacking techniques at the time and I was exposed to learning a lot of them without actually implementing it in code.

Primary 4:Scratch

Jss2:A little about Java from codakid.I learnt it primarily for minecraft modding and that was even the first time I was introduced to minecraft properly.I later moved to the lua course and learnt a little about it and how coding logic works since I could see direct feedback of what my code could do in game.That was when I was introduced to roblox for the first time.I LOVED IT and was very moved to learn lua to make my own games in it especially when I saw the cool games people made with it in the roblox studio platform.That was responsible for me learning lua two years later which was in SS2.

Jss3:A good proficiency in Java.I completed over half a udemy course about it and I gained the experience of setting up my code environment.I learnt a little about minecraft modding as well.Dort get me started on how I set up the environment for that.I remembered the days of tutorialbykaunejoe youtube channel.

SS2:In first term,I completed a full udemy course about html.I learnt a little about Css.I was just into web dev at the time.in third term holiday,I learnt lua for two weeks and mastered a whole book about it.It was primarily because of roblox for me until I realized its lack of community and enough tutorials even for the game engines it had.I was browsing around for other programming languages like ocaml,ruby,closure,the useless F# to check new tastes out especially after I watched a freship video that explained over 50 programming language in like three minutes of hell.I didn't want to learn the big big ones,I wanted to learn the underdog ones so that I could be different.After browsing through a lot of them,I later came with the conclusion to probably learn go solely because of its catchy name and logo.I hardly gave a damn about what it did.Once I heard that google made it,I was in and since dad was going to work in the morning and I was fapping his wif,I had to quickly get something before he left so I wouldn't get bored.So I downloaded in the last like ten minutes.So I quickly learnt Go later on and finished reading two books about it with one over a 150 pages and the other being over 200 pages.I watched a lot of freship videos,learnt the coding map for Go and programming in general,learnt about programming paradigms,learnt about the learning to code process and all sorts.

SS3:I suspended Go in the because of WAEC not like I wanted to.If not for WAEC,I would have been learning Go every weekend but I managed to find some time to code during first term.I decided to taste something new so I chose to learn C++ .Setting up the coding environment was damn hard I already had knowledge of setting up a coding environment with vs code but the problem was finding a standalone C++ compiler so I had to get a code editors that had C++ compilers integrated in them and use them .But I didn't just want to go back to go just yet.

In that Go,at first integrated the compiler with vs code but didn't know how to run the code from vs code with a click of a button without using commands every time I had to run code.It was later when I thoroughly knew about vs code extensions and that's when I learnt about code runner.Which I then integrated my compiler with and running code became as easy as clicking a button.But the problem about integrating C++ compiler with it was that I didn't even know where the compiler was located in the system since it was integrated with an editor.I don't know how I did it but as usual,browsing the deeper folders of the acer,I was able to get the path to the integrated C++ compiler and then pasted it in the code runner executor map file.I had a good environment for C++ but after learning about the steep learning curve of it and attempting to create a simple function which took like six more lines than what it would have been in lua or Go,I decided to quit it.

Here I am today learning python.Initially, after doing some research back in first term,I had interest in Ml engineering so I decided to learn python.But that changed for me when I was gisting with an emotional AI so that I could break it but I only broke myself since I was talking to a lifeless being.Not to mention one guy that was shown in Cnn that stopped talking to an ai for his work in the mean time so that he doesn't go cra cra.Sp that prompted me to stop but I was so into learning ML.Its painful but I decided to change my course to full stack dev in Js.With the experience gained mac,I was setting up the environment for Js.I didn't have any intentions of installing python again after the experience.But dad technically didn't give me a choice.Not like he forced me but he had a point there.I wouldn't be a real programmer if I never touched python in my life not to mention I had some projects I wanted to work on that required pythons ML capabilities that wasn't available in Js.But I already had learning Js in the frontend,backend and with a game engine like playcanvas in mind.So I was thinking of learning Js with full attention and learning python as a secondary.I later moved to python fully and even rescripted my Js learning journey including the game engine to python and Godot.Why?That's because after painfully setting up both a python and Js environment,I could only find a good python tutorial pdf over js which had fewer pdfs from what I searched.The only tutorial pdf I had was js integrated into Html and not pure Js which was a problem.Do you know what?forget all this stress.I am learning python.Thats it.Go to my Python logs for more info about my Python learning path.
