The engineering mindset channel for circuit design

Try out terraria
Creature chat.mod
Castify

Key press on screen app
Trove graphics

An app like automate app for android made by llama lab but turns on airplane mode for a certain period of time to prevent browsing before going to bed and during bed times.

Make the automate app from llama lab but for laptop

Learn how to use my lockbox app

My anime character uses a dagger and a yoyo that can cut through anything which he got the material by using his satellite orbs.Check the anime power brainstorm cjat in poe ai app for my anime character.

Core dumped-Yt channel
Marketing and business skills

PAGE 2

Use the black box method to write tests which is directly mapping the input to output without yet creating the code implementation.

Make the process/algorithm of how your code works on paper before coding it directly.

Make an app that combines two windows latched to each other into a single app or window for my colab.app so that I don't have to make an extension for each code editor.

PAGE 3

Learn location studies and google location use compass app

Case 1:Check if it's a rat and use dark psychology to lure him off and then shout in English,Yoruba,Pidgin.

Idea 1:Phone must always be on.If the phone is off for five minutes,on location and message help to mum,dad and nearby police numbers.Requires automate,the nearby police numbers or the police number around the bus stop to work.

Idea 2:Phone has auto tapper so that when opened it always taps another app to act as if the phone is lagged.The phone has to be restarted.It takes it's restart and actually sends its location.

Idea 3:As soon as location is off.Location can't even be off without the password. The phone should sense speed,record time and rotation to get the direction so as to get the distance travelled and the turn and also a VT graph to get the accurate distance for every deceleration or constant speed.It will map this information to the appropriate location after few minutes but will on the location and mobile data first and start recording location from there and send location and help.Send the help through alarm,whatsapp message.There should also be a fake shutdown--its actually just sleeping and requires a lot of button presses to on

Idea 4:Use dark psychology to keep using your calculator.It requires location and wifi enabled calculator.Use dark psychology to sit in a place where you can see the speedometer and pretend that you are doing math but actually calculating the distance through the speed and with the time on your calculator and record every turn and then use your special calculator to map the location and send it constantly in real time.

Use dark psychology to let me keep my phone in the bus.
Practice all of this while in the car.

Python roadmap

Printing output and receiving input
Variables and the basics of the datatypes

Operators

Assignment operators
Arithmetic operators
Comparison perators
Logical operators
Membership operators
Bitwise operators

Datatypes

Primitive

Numerical processing——Int,float.use the math functions
Boolean
String processing ——Slicing, concatenating,methods,escape characters and format strings.
None->Use it to initiate variables or for value checking

Data structures

Lists——Slicing,methods
Tuples ——methods
Dictionaries ——methods

Blocks

Conditional statements—if,if else,if elif,if elif else,nested if,nested if else and so on.

Loops—for loops, while loops and loop statements like break, continue,pass

Smart Blocks

Functions—lamda,map,range

Making modules
File handling
Classes and the whole concept of OOP
Error handling
Debugging
Logging
Multi tasking
Networking
Testing with pytest
Optionally sets and arrays
Date and time
Everything under the python misc tutorialspoint

Under multitasking

Multi threading —Tutorialspoint
Multi processing—Global ocean
Concurrency——real python
Async io— real python
Queue ——real python

Networking

Socket programming—socket,socket server,select module
Tcp understanding
Internet protocol understanding
Ip address understanding
Http server understanding
Launching an http server in python
Request lib in python
Url understanding
Urllib in python
Domain name understanding
Domain name server understanding
CGI programming in python
Rest API in python
Pytube
Pygr because why not
Web browser

Standard lib

Command line arguments
Virtual environment
File management — pathlib,json,glob,os, shutil
Trace
Zip file

Gui—Pyqt,pysimple gui,wx python,kivy
Web frameworks—Django,flask,fast
Data manipulation and visual —pandas, matplotlib
Image and video formats understanding
Image and video processing —check on cloudinary.com for more info

Math

Lambda calculus
Boolean algebra
Combinatorics
Graph theory
Complexity theory
Statistics
Regression
Matrix
Mad probability
Advanced linear algebra

Scientific programming--Numpy,Scipy
Design patterns

You can branch off here to make your game
Learn

How to use the godot game engine and its api to script
3D modelling,texturing,animation and color theory

Under tutorialspoint

Python technologies
Database
The necessary parts of Devops like Git
The necessary parts of software quality
Finally Machine learning
