

Project B-Time manager

It starts showing a countdown from 8-24 hrs on a project's day submission as set by the user. It is an app that integrates with any timer app the user decides.

The app hides the clock of the system when the countdown starts so that the only way to check how much time you have left is through the countdown.

The countdown will remain hidden so you won't know the time left till it tells you and since the goal is to make you time conscious and not oblivious of the time, it will inform you about the time left every ten-fifteen mins as set by the user. This is to make the users reliant on the time counter for time updates and not to worry about constantly checking the time. And to make sure that the time doesn't just come up unexpectedly that ten-fifteen minutes has gone without the user being aware of the time past, a yellow dot or signal will be blinking on the screen telling the user that the next 10-15 mins interval is about to begin.

While the timer remains hidden, it will deduct 20 secs from the countdown in every 10 mins. This will stack till it reaches two minutes extra for every hour. So at the end of a countdown to a project like say, 15 hrs, the user would have already finished his work a whole 30 mins earlier if he finished his work according to the countdown. He can then relax and brush up his work or do other things.

Is it good and what if the user is not currently using his computer and just opens it, do you have any tips on how the user can check how much time he has left without having to wait till it pops up again.
